Starpharma (SPL)

SPA agreement with FDA for Phase III R-BV Trials

SPL obtains SPA agreement with the FDA for R-BV trials

Starpharma announced today that it has reached agreement with the FDA under a Special Protocol Assessment (SPA) on the design and planned analyses for the two Phase III trials for VivaGel for prevention of recurrent Bacterial Vaginosis (R-BV). The company will run two Phase III trials in parallel with ~600 patients each across sites in North America, Europe and Asia. The primary endpoint of the trials will be rate of recurrence of BV during 16 week treatment period as measured by Amsel's criteria in women treated with VivaGel vs. women treated with placebo.

SPA and its significance for SPL

The SPA is a binding written agreement between the FDA and SPL that the design, endpoints and statistical analysis approach of the Phase III R-BV trials are acceptable and adequately address all the objectives in support of a regulatory submission for the drug's approval. This implies that as long as SPL's Phase III R-BV trials follow the agreed upon protocol to the letter and data from the trial supports the safety and efficacy of the product, results from the trial can form the basis for VivaGel's NDA filing for approval and will be sufficient to support FDA's review and approval decision. We note that having an SPA does <u>not</u> guarantee that VivaGel will get approved, but it does reduce some regulatory uncertainty in terms of what the agency requires in order to potentially approve VivaGel. This is a positive tick for the company as far as we are concerned.

Maintain Buy rating and Valuation of \$1.07

We value SPL using a risk-weighted DCF at \$1.07/sh. We retain our Buy recommendation based on the near term VCC related royalties, results from docetaxel trial which could be a game changer and strong cash position of \$27.8m which should fund it through FY15. Key catalysts for a re-rating include a) launch of VivaGel Coated Condom (VCC) in Japan this quarter, b) additional regulatory approvals for VCC, c) Top-line results from dendrimer-docetaxel Phase I trial in CY1H15, d) licensing deal for BV symptomatic relief in FY16 and e) results from Phase III R-BV trials in CY2H15.

SPA agreement with FDA on R-BV Trials

Starpharma announced today that it has reached agreement with the FDA under a Special Protocol Assessment (SPA) on the design and planned analyses for the two Phase III trials for VivaGel for prevention of recurrent Bacterial Vaginosis (R-BV).

Having an SPA does not guarantee that VivaGel will get approved, but it does reduce some regulatory uncertainty in terms of what the agency requires for demonstrating the safety and efficacy of VivaGel for R-BV in order to potentially approve it.

An SPA provides companies with the ground rules on how to conduct the clinical trials and also establishes FDA acceptable endpoints.

While having an SPA is not mandatory for approval, in our view it's appealing from a risk reduction point of view for SPL. Since there is no other approved treatment for prevention of R-BV, the SPA will be helpful and valuable because it lays down a definitive path for SPL to follow.

Ultimately, it is the data from the Phase III trials on efficacy and safety which will decide whether the drug gets approved or not. However, what the SPA implies is that as long as SPL's Phase III R-BV trials follow the agreed upon protocol to the letter, results from the trial can form the basis for VivaGel's NDA filing for approval and will be sufficient to support FDA's review and approval decision.

From our perspective, it is a positive tick for the company, gives us comfort around what FDA wants to see to potentially approve VivaGeI for R-BV, with the focus now on execution by SPL's team.

What is an SPA?

A Special Protocol Assessment (SPA) is a written agreement between a trial's sponsor (in this case, SPL) and the FDA regarding the design, endpoints and statistical analysis approach of a Phase 3 clinical trial, results from which could potentially support approval of a New Drug Application (NDA).

SPAs provide no guarantee of approval but are intended to help the drug sponsor and regulators put together a binding agreement of how a clinical study should be conducted. It is FDA's way of definitively clarifying to a sponsor that 'what they are proposing to do will produce the answers which FDA thinks is necessary from the point of getting approval for the drug'.

Applying for an SPA rather than going directly into a Phase III trial means additional time for sponsor companies. Under the rules of the Prescription Drug User Fee Act (PDUFA), the FDA has 45 calendar days to respond to an SPA request. However, if there are issues the trial protocol may need to be amended and re-submitted which would then have a new 45 day review clock. In contrast, after an IND submission if the sponsor does not get any comments from the FDA for 30 days, they assume FDA is ok with the protocol and initiate the trial. Of course there is a risk that the FDA may come back much later with issues, which implies SPA is a much more definitive nod from the FDA.

The question thus arises for sponsors whether in their particular instance the additional time is worth it given the potential benefit the SPA will provide.

The process of obtaining an SPA is also a rigorous process. Some companies may employ consultants, lawyers for it which increases cost. Depending on how clean the application is i.e. how robust the pre-submission work is, the SPA can be granted within 45 days to a few months. We understand SPL obtained the SPA agreement within 45 days which is impressive.

Not all companies who ask for an SPA reach agreement with the FDA. In one of the ASCO 2014 meeting publications, authors evaluated 10 years of SPA submissions to the Office of Hematology and Oncology products. There were 532 SPAs submitted during the 10-year period examined. These included 344 original submissions and 188 resubmissions. Agreement was reached only on a minority ~25% of the applications (132 of 532) submitted to the FDA.

Additional time needs to be considered seriously given that the more time the drug takes to get to the market, the less of its patent life it will spend on the market.

Do companies find the SPA agreement useful?

We tracked the number of assessments done by FDA under SPA annually since 2001 (See Table below). We can assume that if companies did not think the SPAs were useful, they would not be requesting the FDA for it. They seemed to be gaining popularity year on year between 2001- 2007. From 2008 there has been a drop in requests which we attribute to companies being increasingly required to justify the time versus benefit of going down the SPA route to their investors and analysts and also due to the fact that it is not easy to get SPA agreement from the FDA as evident from statistics from the ASCO paper mentioned above.

Table 1 - Annual requests for Special Protocol Assessments to the FDA

Year	Number of Special Protocol Assessments evaluated by FDA
2013	220
2012	288
2011	313

2003	293
2002	248
2001	125

SOURCE: FDA, BELL POTTER SECURITIES

In which instances can SPA's be really helpful?

Generally not all companies need to go down the SPA route. However, there are certain instances in which we believe SPAs will be particularly helpful:

- If the drug in question is the sponsor company's first drug in late-stage development
- If the drug is first-in-class
- If there is no other drug approved for the indication implying no defined approval pathway
- If the drug is targeting an orphan drug indication with no previously approved treatment

In summary, we believe that if there are significant uncertainties around the development program, no defined regulatory pathway or uncharted territory, having an SPA will be extremely valuable and helpful. We also think that if there is any room for interpretation for a final result, then having an SPA will significantly reduce that subjectivity risk. Having an SPA is almost like having an insurance product; it is beneficial if you need it.

Why we think having an SPA agreement is good for SPL?

In our view, SPL having a SPA agreement with the FDA for its Phase III R-BV trials is good from a risk reduction point of view. There is no other approved treatment for prevention of R-BV. Hence, the SPA agreement will be helpful and valuable because it lays down a definitive path for SPL to follow. It not only provides SPL with ground rules on how to conduct the clinical trials but also establishes FDA acceptable endpoints.

We believe that there is room for interpretation around what a preventative treatment may be required to demonstrate in terms of efficacy and safety. Hence, we are more comfortable now, with the SPA grant, that the trial is designed to produce data which will demonstrate safety and efficacy as the FDA deems as necessary for VivaGel to ultimately obtain marketing approval.

Two areas which we believe had room for interpretation were:

- VivaGel product for BV is a continuous use product: This means that the treatment is effective only as long as the patient is using VivaGel. The BV symptoms reappear once the product usage is stopped. There is room for interpretation therefore whether the treatment should be considered preventative if during follow up period after cessation of treatment, symptoms reappear. Having the SPA, means that the FDA views the rate of recurrence of BV in both the VivaGel group and the placebo group at the end of treatment i.e. week 16 as acceptable endpoint for demonstration of efficacy.
- Safety bar for chronic use product may be higher: For prevention of recurrence, VivaGel will be required to be used continuously vs. a short term course required for acute treatment. Thus, there exists a risk that the safety bar set for VivaGel may be higher. We do not have any precedence given that there is currently no approved treatment for Prevention of BV. Hence, it is unclear to us at this point whether the safety thresholds for a chronic use BV product (i.e. designed to be used continuously) may be more stringent from the regulatory point of view. The SPA agreement likely defines the safety parameters which reduces the uncertainty around this.

In summary, from our perspective, the SPA agreement is a positive tick for the company, gives us comfort around what FDA wants to see to potentially approve VivaGel for R-BV, with our focus now on execution by SPL's team.

Path Forward – Phase III BV Prevention of Recurrence Trials

Following the SPA agreement, SPL will initiate two Phase III trials in parallel with ~600 patients each across sites in North America, Europe and Asia. Quintiles, one of the leading Contract Research Organisations (CRO) have been engaged to conduct the trials. We expect enrolment in the trials to start shortly.

The design of both the Phase III trials will be identical. We understand that the design for the Phase III R-BV trials is very similar to the Phase II R-BV trial and has the nod from both the FDA and the EMA.

In each trial, patients with recurrent BV (3 or more episodes of BV in the last 12 months), will be treated with oral antibiotic metronidazole for 7 days and then screened to ensure that they are free of acute BV. Women will be then randomised to receive either 1% VivaGel or Placebo gel, every second day at bedtime for 16 weeks, followed by a 12 week follow-up period.

The primary endpoint of the trial will be rate of recurrence of BV by or at the completion of 16 week treatment period, as measured by Amsel's criteria. The first 3 criteria's below are stipulated by the FDA as the Amsel's criteria for BV diagnosis.

The four Amsel's criteria are:

· Presence of white to grey homogeneous discharge,

- · Whiff test indicating fishy odour with addition of potassium hydroxide,
- Presence of clue cells ≥ 20% of total epithelial cells and
- Vaginal pH greater than 4.5.

We note that in the Phase II R-BV trial, at week 16 (EOT) when R-BV was assessed using FDA stipulated Amsel criteria of BV diagnosis, the rate of recurrence of BV was only 12% in the 1% VivaGel arm vs. 28% for placebo, and the result was close to statistical significance with p=0.0588. This difference represented a 56% relative risk reduction in R-BV with 1% VivaGel vs. placebo. This is encouraging as the criteria used for diagnosis was regulator specified and we are optimistic that higher number of patients could potentially recreate the Phase II results but with statistical significance.

Valuation

We value SPL at A\$1.07/sh

We value SPL using a risk-weighted DCF sum-of parts model. Our valuation is the sum of NPVs of individual assets based on the different indications targeted by Starpharma's VivaGel, internal lead drug delivery programme dendrimer-docetaxel and internal lead agrochemicals programme dendrimer-glyphosate. We also include the marketed diagnostics/laboratory reagents asset which is a marginal ongoing revenue stream for SPL. Each of the individual DCF models use risk-adjusted revenue numbers based on the probability of success in the clinical trials for each indication. The probability of success we attribute to each indication varies according to the development phase for each.

Our DCF valuation model is based on a WACC of 16.0%. We assume a terminal growth rate of 1% to arrive at our base case valuation of A\$1.07/sh.

Table 2 - Summary of Valuation	
Forecasts	Base case
Enterprise Value from DCF (AUDm)	284.5
Add: Cash at end FY14E (AUDm)	23.4
Less: Debt at end FY14E (AUDm)	0.1
Equity Value (AUDm)	307.8
Total diluted shares at end FY14E (million)	288.3
Value per share (AUD)	\$1.07
Current Share price (AUD)	\$0.58
Expected Capital Growth	86.1%

SOURCE: BELL POTTER SECURITIES ESTIMATES

At a WACC of 16%, for every 0.5% change in terminal growth rate, our base case valuation changes minimally by ~A\$0.01. We also established that at a terminal growth rate of 1%, every 1% change in WACC, caused an A\$0.08-A\$0.12 change in our valuation.

				WACC

Dendrimer-Glyphosate	Crop protection	Pre Regulatory Submission	TBC	2H15/1H16	0	NA	NA	NA	5.0%

NOTE: OUR DENDRIMER-DOCETAXEL DEAL ASSUMPTIONS ARE CONSERVATIVE REFLECTING ITS EARLY STAGE. IT COULD POTENTIALLY HAVE ADDITIONAL VALUE FOR EACH ADDITIONAL INDICATION THAT THE LICENSEE PURSUES. WE DO NOT INCLUDE COMMERCIAL MILESTONES IN OUR MODEL AT THIS STAGE.

ROYALTIES ARE LIKELY TO BE TIERED FOR EACH DEAL. WE ASSUME FLAT RATE AT MID POINT OF RANGE FOR NOW.

SOURCE: BELL POTTER SECURITIES ESTIMATES

Upside Risk to our valuation

We have not modelled SPL's potential revenue flow from its partnerships with Nufarm (agrochemicals), Gowan Company (agrochemicals), Makhteshim Agan (agrochemicals), Astra Zeneca (drug-delivery), Eli Lilly (drug delivery), Elanco (drug delivery), GSK (drug delivery) and from its multiple undisclosed partnerships both in drug delivery and agrochemicals. These partnerships becoming substantial in future and converting to a commercial licensing deal with financial terms would lead to an upside to our estimates.

At this stage, we do not value VivaGel's opportunity in Viral Conjunctivitis and SPL's second internal candidate from drug-delivery Dendrimer-Oxaliplatin, given the early nature of these programmes. These programmes moving ahead into the clinic would be a potential upside to our estimates.

Also, we note that docetaxel (Taxotere) made by Sanofi Aventis is currently approved for multiple indications including breast cancer, head and neck cancer, gastric cancer, prostate cancer and non-small cell lung cancer (NSCLC). SPL has previously reported results from animal studies of dendrimer-docetaxel, which demonstrated that dendrimerdocetaxel has superior efficacy to docetaxel alone across a wide range of tumours namely prostate, lung, ovarian and breast. SPL's closest competitor BIND Therapeutics, which has an improved docetaxel formulation in development, is pursuing NSCLC and prostate cancer indications. At this stage for SPL, we model dendrimer-docetaxel's opportunity for the first solid tumour indication the company may pursue. However, depending on the results from the Phase I trial, which is recruiting patients with various solid tumours, SPL or a potential licensee, may decide to pursue more than one indication in parallel. This could considerably increase the market opportunity for this asset. We envisage that expanded indications for dendrimer-docetaxel will lead to material upgrades in our numbers. We will revisit our assumptions on the basis of the Phase I dendrimer-docetaxel trial results.

Starpharma Holdings Ltd. (SPL)

COMPANY DESCRIPTION

Starpharma is a Melbourne-based platform company commercialising the science of nanoscale polymers called dendrimers. Its proprietary dendrimer technology is versatile with wide applicability across multiple sectors including pharmaceuticals, agrochemicals and industrial applications. Starpharma's lead product is VivaGel which is being developed as an anti-microbial coating for Ansell and Okamoto condoms offering protection against Sexually Transmitted Infections, as well as a topical microbicide to prevent the recurrence of the common vaginal infection in women, Bacterial Vaginosis (BV). SPL is also working on improved formulations of leading cancer drugs as well as agrochemicals both internally and with external partners. Substantial shareholders include Allan Gray, M&G, Acorn Capital and Dow Chemical Company. Their combined holdings represent ~41.8%.

INVESTMENT STRATEGY

We believe that investor sentiment is returning to the stock with the first marketing approval received for the VivaGel Coated Condom (VCC) in Japan. We expect multiple catalysts to play out over the next 3 -12 months which could further de-risk the platform technology and demonstrate its commercial viability. The key inflection point for the stock, in our view, will be results from the Phase I dendrimer-docetaxel trial. We expect interim data from the trial in CY2H14, with top-line data from the trial in CY1H15. We maintain our Buy recommendation on SPL, based on the company getting its first product from the VivaGel portfolio on the market and near-term revenues ensuing from it, results from the Phase I docetaxel trial and a strong cash position of \$27.8m which should fund it through FY15.

KEY RISKS

We see the following key stock specific risks to our investment thesis on Starpharma:

- Clinical risk: There is a risk that SPL's clinical trials primarily the Phase III R-BV trials
 and the Phase I dendrimer-docetaxel trial may fail to demonstrate meaningful safety
 and efficacy. This may jeopardise the potential for the company to license the products
 and/or pursue further clinical development.
- **Technology risk:** SPL is a platform company, with its entire pipeline based on its proprietary dendrimer technology. Any setback clinically or commercially is likely to put the viability of the company's technology at risk.
- Regulatory risk: Any further delay in receiving marketing approval for VivaGel coated condom or delay in its launch will negatively impact our revenue forecasts. This risk also extends to other pipeline products in terms of getting regulatory agreement to conduct clinical trials and marketing approval for launch in various markets.
- Partnering risk: The basic premise behind our investment thesis for SPL is that all its
 major products get licensed at attractive terms with the partner being responsible for all
 commercialisation and any further development as required. If SPL fails to secure
 partnerships at attractive terms, our forecasts will be negatively impacted. Furthermore,
 if any of SPL's existing collaborations should be terminated, it is likely to shake the
 markets confidence in SPL's technology and its commercial viability.
- Commercial risk: The VivaGel coated condom sales and revenue from partnerships
 with Okamoto and Ansell could fail to meet our expectations due to poor
 commercialization effort, delays in launch, unfavourable experience of consumers with
 the product, better performance of a competing product etc.
- Funding risk: Delays in partnering of products may impact SPL's funding position.
 Increase in costs of trials beyond what we currently estimate may require SPL to raise additional capital before it can become financially self-sustainable.

SPL has \$27.81m cash at the end of FY3Q14 and has burned ~\$0.7m/month on average over the last twelve months

SOURCE: BELL POTTER SECURITIES ESTIMATES

Recommendation structure

Buy: Expect >15% total return on a 12 month view. For stocks regarded as 'Speculative' a return of >30% is expected.

Hold: Expect total return between -5% and 15% on a 12 month view

Sell: Expect <-5% total return on a 12 month view

Speculative Investments are either start-up enterprises with nil or only prospective operations or recently commenced operations with only forecast cash flows, or companies that have commenced operations or have been in operation for some time but have only forecast cash flows and/or a stressed balance sheet.

Such investments may carry an exceptionally high level of capital risk and volatility of returns.

Bell Potter Securities Limited ACN 25 006 390 7721 Level 38, Aurora Place 88 Phillip Street, Sydney 2000 Telephone +61 2 9255 7200

Disclosure of interest:

Bell Potter Securities Limited, its employees, consultants and its associates within the meaning of Chapter 7 of the Corporations Law may receive commissions, underwriting and management fees from transactions involving securities referred to in this document (which its representatives may directly share) and may from time to time hold interests in the securities referred to in this document.

Disclosure: Bell Potter Securities acted as lead manager in the October 2011 placement and SPP and received fees for that service.

Biotechnology Risk Warning:

The stocks of biotechnology companies without strong revenue streams from product sales or ongoing service revenue should always be regarded as speculative in character. Since most biotechnology companies fit this description, the speculative designation also applies to the entire sector. The fact that the intellectual property base of a typical biotechnology company lies in science not generally regarded as accessible to the layman adds further to the riskiness with which biotechnology investments ought to be regarded. Stocks with 'Speculative' designation are prone to high volatility in share price movements. Clinical and regulatory risks are inherent in biotechnology stocks. Biotechnology developers usually seek US FDA approval for their technology which is a long and arduous three phase process to prove the safety, effectiveness and appropriate application or use of the developed drug and even after approval a drug can be the subject of an FDA investigation of subsequently discovered possible links between the drug and other diseases not previously diagnosed. Furthermore, the Australian exchange listed biotechnology sector is subject to influence by the global biotechnology sector, particularly that in the USA. Consequently, Australian exchange listed biotechnology stocks can experience sharp movements, both upwards and downwards, in both valuations and share prices, as a result of a re-rating of the sector both globally and in the USA, in particular. Investors are advised to be cognisant of these risks before buying such a stock including Starpharma. For a list of risks specific to Starpharma please refer to Page 8 of this note.

ANALYST CERTIFICATION:

Each research analyst primarily responsible for the content of this research report, in whole or in part, certifies that with respect to each security or issuer that the analyst covered in this report: (1) all of the views expressed accurately reflect his or her personal views about those securities or issuers and were prepared in an independent manner and (2) no part of his or her compensation was, is, or will be, directly or indirectly, related to the specific recommendations or views expressed by that research analyst in the research report.
